

# Sunnyfi · The 12 Atoms

Quick Reference · every number in the app is a combination of these.

---

## EQUITY (YOUR SHARES)

### A1 — Equity Market Value

The dollar value of all the shares you currently own.

*Math.* Add up shares × current price for every open position.

**Example.** 100 META @ \$620 + 50 NVDA @ \$612 = **\$92,600**

### A2 — Equity Cost Basis

What you originally paid for those shares.

*Math.* Add up shares × average cost for every open position.

**Example.** 100 META @ \$400 avg + 50 NVDA @ \$300 avg = **\$55,000**

### A3 — Shares Realized

Profit or loss banked from shares you've already sold. Window-filterable.

*Math.* Add up the realized P&L from every sell.

**Example.** Sold 50 META at \$620 (avg \$400). Realized =  $(620 - 400) \times 50 = \textbf{+\$11,000}$

## PREMIUM FLOW (OPTION CASH, GROSS)

### A4 — Premium Collected

Cash you took in by **selling** options (short calls + short puts).

*Math.* Add up contracts × 100 × premium for short opens.

**Example.** Sold 5 META 700-strike calls @ \$2.50 =  $5 \times 100 \times 2.50 = \textbf{\$1,250 collected}$

### A5 — Premium Paid

Cash you spent **buying** options (protective puts, bought calls).

*Math.* Add up contracts × 100 × premium for long opens.

**Example.** Bought 2 META 600-strike puts @ \$4.00 =  $2 \times 100 \times 4 = \textbf{\$800 paid}$

### A6 — Buy-to-Close Debit

Cash you paid to **close** an option you had sold (buying back a short).

*Math.* Add up contracts × 100 × close-premium for closes of shorts.

**Example.** Bought back the 5 META 700 calls @ \$1.00 =  $5 \times 100 \times 1 = \textbf{\$500 debit}$

### A7 — Sell-to-Close Credit

Cash you received by **closing** an option you had bought (selling a long).

*Math.* Add up contracts × 100 × close-premium for closes of longs.

**Example.** Sold the 2 META 600 puts back @ \$6.00 =  $2 \times 100 \times 6 = \textbf{\$1,200 credit}$

## OPTION REALIZED P&L;

## A8 — Option Realized

The settled gain or loss on every option you've fully closed. Filterable by call/put × short/long × window.

*Math.* For each matched open + close pair:  $(\text{open premium} - \text{close premium}) \times 100 \times \text{contracts}$  if the open was short; flip the sign if it was long.

**Example.** Sold META 700 calls @ \$2.50, bought them back @ \$1. Realized =  $(2.50 - 1) \times 100 \times 5 = \text{\$750 gain}$

## OPEN-LEG STATE (RIGHT NOW, NO WINDOW)

### A9 — Open Short Premium

Premium on shorts you sold that haven't been closed yet — still on the books.

*Math.* Sum the original premium on the still-open contracts of every short open.

**Example.** Still holding 3 of the original 5 META 700 calls @ \$2.50 =  $3 \times 100 \times 2.50 = \text{\$750 outstanding}$

### A10 — Open Long Premium

Premium you've paid on longs that haven't been closed yet — your remaining option cost.

*Math.* Sum the original premium on the still-open contracts of every long open.

**Example.** Still holding 2 META 600 puts @ \$4 =  $2 \times 100 \times 4 = \text{\$800 outstanding}$

### A11 — Live Leg Count

How many option legs are currently open. Filterable by call/put × short/long × live state.

*Math.* Count of opens minus matched-close contracts.

**Example.** 3 short calls + 2 long puts = **5 live legs**

## HISTORICAL / TIME-SERIES

### A12 — Historical Portfolio Value

What your current shares would have been worth on any past date.

*Math.* Today's share count × that day's close price, summed across tickers. Carry-forward fills in missing daily closes.

**Example.** Today's 100 META × META close on May 22 (\$600) = **\\$60,000** (for META on that day)

## COMMON COMBINATIONS

|                         |                                              |                                                                                                         |
|-------------------------|----------------------------------------------|---------------------------------------------------------------------------------------------------------|
| Unrealized P&L          | $A1 - A2$                                    | Paper gain/loss on the shares you still hold.                                                           |
| Realized P&L            | $A3 + A8$                                    | Profit you've actually banked — sold shares plus closed options.                                        |
| Total P&L               | $(A1 - A2) + (A3 + A8)$                      | Everything: paper plus booked.                                                                          |
| Income (canonical)      | $A4 - A6$                                    | Net rent from writing options. Premium in, minus what you paid to close. <b>The Income page number.</b> |
| Gross Premium Collected | $A4$                                         | All the option premium you took in, before any buybacks.                                                |
| Weekly Portfolio Delta  | $A12(\text{today}) - A12(\text{today} - 5d)$ | This week's value change on your current holdings.                                                      |

|                                |                                                           |                                                                     |
|--------------------------------|-----------------------------------------------------------|---------------------------------------------------------------------|
| <b>Put Protection Coverage</b> | $A8(\text{short calls}) \div A10(\text{puts}) \times 100$ | Share of open put-protection cost paid for by realized call income. |
|--------------------------------|-----------------------------------------------------------|---------------------------------------------------------------------|

## HOW TO USE THIS CARD

When you see a number on a screen and want to know where it came from, find its metric label and look it up — it will reduce to one of the combinations above. When you build a new screen, pick the atoms you need, decide the filters (ticker, window, call/put), and read those atoms from the shared hook layer. Pages never invent new arithmetic. Same number on two screens means same atoms + same filters; different number means a different choice, labeled differently.
